

## ABSTRACT OF THE DISCLOSURE

An object of the present invention is to easily search for shops having delivery areas including user terminals. When two users access a shop search site of a server by use of user terminals (step S1), the same contents are displayed on both of the user terminals in the following processing: One of the users is set as the merchandise purchaser (step S2), the position information of the other user, the merchandise receiver, is transmitted to the server (step S3), and the desired shop kind is set by one of the users (step S4). Then, shops of the shop kind the delivery areas of which include the receiver are retrieved and displayed.
